				Max Weight Denominators	15.3	17.1	15.3	27.0	24.3	9.0
How to apply this										
Cluster wise raw marks = Sum of 4 Likert (after reversing) + Forced-Choice Points										
Rescaling for report = $1 + [(Cluster\ raw\ marks - 4) / 18] * 8$										
RAISEC Mapping: Each of the 12 clusters feeds into two RIASEC codes (primary 0.7, secondary 0.3)										
RIASEC Normalization = $[Weighted\ sum\ for\ X / Max\ Weight\ feeding\ X] * 9$
